**Predictive Services Discussion:** Wind will increase today across portions of the Northwest, Northern Rockies, northeast California, eastern Idaho, and western Wyoming. Scattered, mostly wet thunderstorms will develop in the southern Great Basin, with isolated storms in southern California. Isolated mixed wet-and-dry thunderstorms are possible in Montana.

### **Transfer Of Command**

Risks to fireline personnel increase significantly during transfer of command periods regardless of the size or complexity of the incident. There is a high potential for fatalities, serious injuries, or incidents with potential during transfer of command periods (some have occurred in the past). Be proactive in mitigating the risks by proper implementation of LCES—Lookout, Communications, Escape Routes, and Safety Zones.

- Factors for increased risks to fireline personnel during transition periods include:
  - No, or poor, briefing of incoming personnel
  - Lack of fire weather and behavior information, both forecast and observed
  - Communications; face-to-face briefings may not be possible and radio frequencies may be overextended and/or changing due to the increased demands on the system.
  - Initial attack resources may not have checked-in and the Incident Commander may not be aware of the number, type and location of all resources.
  - Location of safety zones and escape routes may not be known and communicated to all resources.
  
- Mitigation actions to take:
  - Lookouts: Post and maintain your own lookouts.
  - Communications: Maintain existing communications with your own and adjacent resources, as well as your original supervisor, while you are developing communications with incoming adjacent resources and your new supervisor.
  - Escape routes and safety zones: Identify escape routes and assure incoming resources are aware of their locations; be aware that your original escape routes and safety zones may no longer be accessible due to changing fire behavior or your increased distance from them.
